RiseStake

Stake crypto, shake your phone for 60 seconds, wake up or lose it

The Problem & Our Solution

Snoozing is free. We make waking up cost something real, so your body and your wallet both get you out of bed.

- Traditional alarms are dismissed in one tap, with no real consequence for going back to sleep.
- RiseStake requires staking SOL before sleep, putting real money on the line.
- To silence the alarm, users must complete a 60-second shake or squat challenge.
- Success returns the stake plus a share of others' forfeited stakes; failure forfeits it.

How It Works

From staking to sleep to shake: a simple on-chain loop that turns waking up into a financial and physical commitment.

- User connects wallet and stakes SOL via Solana Pay before going to sleep.
- Alarm triggers at wake time; phone accelerometer starts a 60-second shake/squat mini-game.
- Anti-cheat motion pattern validation confirms real physical movement, not spoofing.
- Smart contract (Anchor) settles: successful wakers reclaim stake plus share of forfeited pool.
- Supabase logs motion data off-chain; results and streaks are recorded on-chain for the leaderboard.

Built with

Solana, React Native, Solana web3.js, Anchor, Phone accelerometer API, Supabase for off-chain motion logs, Solana Pay

Why Now & What's Next

Fast, cheap Solana transactions make micro-stakes practical, right as accountability apps go mainstream.

- Fitness and accountability apps are converging with crypto staking mechanics.
- Solana's speed and low fees make small daily stakes and payouts feasible.
- Next: anti-spoofing ML model to strengthen motion verification.
- Next: squad/group staking mode for shared accountability.
- Next: partnerships with fitness and insurance apps for streak-based perks.
